

The Problem

Browsing online accumulates data which needs to be stored locally on your machine for internet browsers to work effectively. However, some of this data is used by third parties, who track user behaviour and use it to send targeted advertisements.

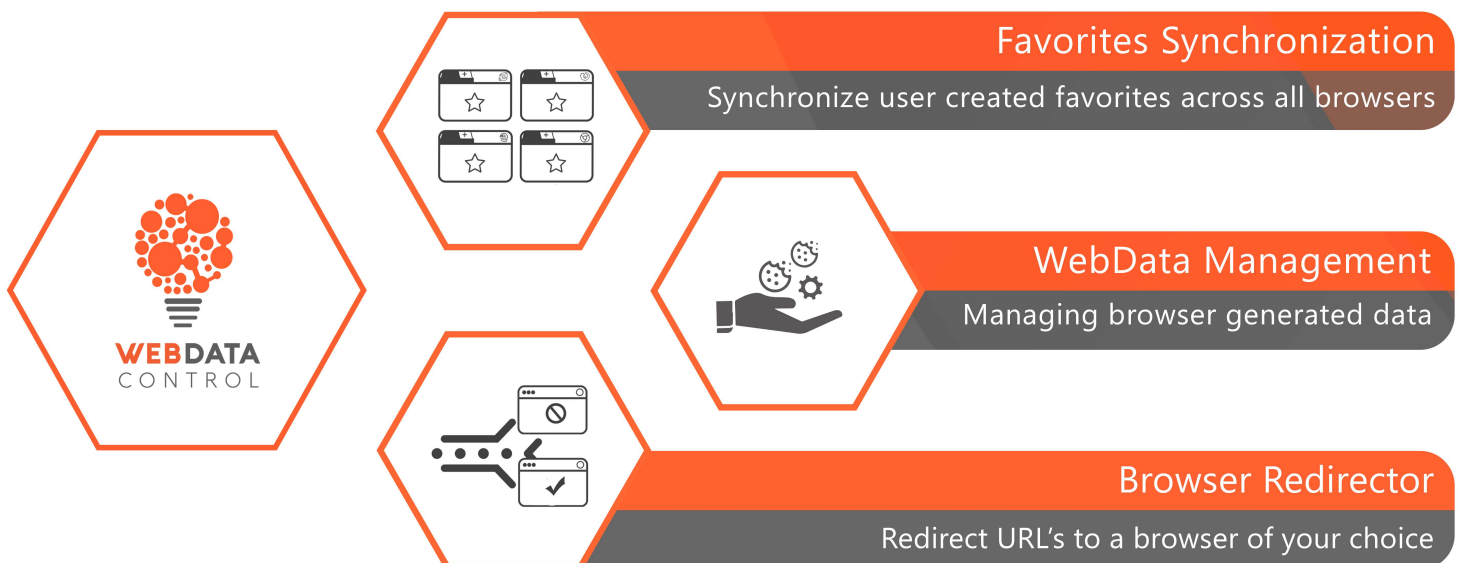

Managing this data within an enterprise environment is a balance between giving the user a consistent experience whilst not impacting user logon times or infrastructure costs.

Avanite's WebData Control adds intelligence to Profile Management for web apps, helping you to take control of the growing problem of managing browser generated data, specifically cookies, history, temporary internet files and favorites.

WebData Control focuses on maximising the end user experience by allowing essential web data to be retained, ensuring that user favorites are synchronized across all browsers and redirecting URLs to an appropriate browser.

The Solution

The Benefits

Faster Login Times

Profile bloat has always been an issue with roaming users. The larger the profile the longer it will take to logon. Browser data can add 100s of megabytes to a user profile, a large portion of which is not essential. With WebData Control enterprise businesses on average see a 60% improvement on their user logon times.

Reduced Infrastructure

This data increases the infrastructure storage costs and the volume of traffic across your network as your users logon and logoff their machines. WebData Control reduces the storage requirements for each browser and therefore reduces volume of traffic across your network.

Multiple Browser Support

Certain websites require explicit features that are not available on all internet browsers. Therefore, enterprise environments often support multiple web browsers. WebData Control can manage browser data across all the common web browsers including: Internet Explorer, Microsoft Edge, Google Chrome and Mozilla Firefox.

Complete Cookie Management

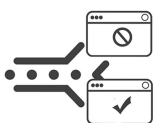

WebData Control is the only solution available today that provides complete administrative control over internet cookies. You can granularly define which cookies are to be retained and which are to be removed.

Favorites Synchronization

Do you want to help users find web resources quickly and efficiently? WebData Control allows you to publish a series of default favorites which will always appear in a particular browser.

Browser Redirector

To ensure your users have the best possible experience, Browser Redirector allows for specific URLs to open in a particular browser. This overcomes compatibility and rendering issues by redirecting to a preferred browser.
