

The fast, simple way to go global with Chrome OS

CloudReady delivers the security & manageability of Chromebooks—anywhere, on any device

When it comes to developing and deploying a consistent IT strategy, multinational organizations often discover that expanding into some countries presents some serious technology challenges.

As more companies embrace web-based applications and the easy management and unparalleled security of the Google Chrome ecosystem, being able to conquer those region-specific challenges becomes mission critical.

A solution for your global IT challenges

CloudReady is an operating system that turns your computers into Chrome devices. Based on Google's open source Chromium OS, CloudReady is the secure, manageable, and fast way to deploy and manage the Chrome environment on your organization's endpoints—no matter where they are in the world.

CloudReady also integrates natively with GSuite and the Google Admin console, allowing users and devices to be managed, tracked, and organized with any extra time or effort. Simply enroll your CloudReady machines in your existing Admin console for the control and visibility you need to manage your fleet quickly and seamlessly.

Go Google **anywhere**

With CloudReady, you don't need to make exceptions to your global IT strategy. As a lightweight, easy-to-install operating system, CloudReady isn't subject to foreign restrictions, or the high import tariffs of countries such as Brazil. It's a hassle-free way to deliver the familiar Chromebook experience, reliably and efficiently.

On **any device**

No need to purchase new Chromebooks or Chromeboxes to finalize your global Chrome deployment, or to be limited to specific hardware models. CloudReady is device agnostic: Install it on the hardware that fits your business needs, whether that's your existing fleet or brand new computers, and let your users get to work.

According to **your time frame**

If you're up against tight project deadlines as you roll out offices in new regions of the world, you don't necessarily have time to procure new Chromebooks. Using any of our supported mass deployment methods, your team can deploy CloudReady to hundreds or thousands of machines within days.
